

## Bio-Logics Blood Bank ID Wristband System

- **Unique benefits of the Bio-Logics Blood Band:** Using blood ID tags and labels produced from the patient's wristband provides a complete audit trail from the sample draw through the transfusion, ensuring correct identification at every step.
- **Save Money:** You save money by eliminating the need to reband a patient after 72 hours and eliminate the confusion caused by using multiple blood numbers for a single patient's blood.
- **Positive patient identification:** Generate blood labels at bedside directly from the patient's wristband. Labels provide physical evidence that the patient was wearing a wristband and that the ID band was used to generate an identification label for the blood. This compliments existing computer generated lab labels and helps to prevent work-arounds and errors.
- **Most Cost Effective Solution:** Generate blood bank specimen identification labels on demand. This eliminates costly wasted labels or the need to reband the patient if additional labels are needed.
- **Forward Compatibility:** Rest assured knowing that patient photos, barcodes and RFID can be easily added at any time.
- **Improved Barcode Scan Rate:** Larger barcodes printed on the flat ID band surface significantly improve first-scan rate (even on smaller wrists).
- **Durability of Printed Information:** Designed to withstand the rigors of daily hospital wear with smudge proof printing and barcoding that is chemical and water resistant even after patient showering.
- **Tamperproof:** Designed to prevent tampering or provide evidence of tampering so that bands can not be easily removed by patients.
